

For this exercise, I will use an actual production dashboard from my team as a case study to assess its strengths and weaknesses using data visualization principles and to explore potential redesign opportunities that could improve clarity, usability, and decision support.

Below is the progressive production dashboard of coin displayed on a large screen in the production shop floor. The purpose is to provide real-time visibility of production performance, quality indicators, and target attainment to operators, supervisors, and management. By making key operational information readily accessible, the dashboard enables stakeholders to quickly identify issues, align decisions, coordinate corrective actions, and implement timely interventions necessary to achieve daily and monthly production goals.
